

Considering your thoughts on your chosen area of interest for your project:

- Which of the methods described in this week's reading would you think would suit your purpose?
  - Which data collection methods would you consider using?
  - Which required skills will you need to have or develop for the chosen project?
- 

My chosen area of interest is cybersecurity, focussing on state-sponsored cyberterrorism. To narrow it down even further, I have chosen to analyze the impact of state-sponsored attacks by the United States, Russia, and China.

**Which of the methods described in this week's reading would you think would suit your purpose?**

If possible, I think finding and analyzing a case study would be very effective for this topic, because it would give us primary and secondary data on events that occurred in the past. Using an exploratory methodology and a qualitative approach would allow me to study recent attacks, the reasons for said attacks, their impact, as well as the legal and ethical justification (or the lack thereof).

**Which data collection methods would you consider using?**

Based on my chosen area of interest, I believe that data could be efficiently gathered by focussing on case studies, statistics, and text analysis. If possible, conducting interviews with subject matter experts, professionals, and/or government employees may be a great way to discover and collect relevant data.
